A Catalogue of Software for Matrix Functions. Version 1.0

Nicholas J. Higham* Edvin Deadman†

February 12, 2014

Abstract

A catalogue of software for computing matrix functions and their Fréchet derivatives is presented. For a wide variety of languages and for software ranging from commercial products to open source packages we describe what matrix function codes are available and which algorithms they implement.

Contents

*School of Mathematics, The University of Manchester, Manchester, M13 9PL, UK (nick.higham@manchester.ac.uk, http://www.maths.manchester.ac.uk/~higham, edvin.deadman@manchester.ac.uk, http://www.maths.manchester.ac.uk/~edeadman).

1 Introduction

The earliest widely available software for computing functions of matrices is probably the function named `fun` in the original 1984 Fortran version of MATLAB:

```
      < M A T L A B >
    Version of 01/10/84

<>
help fun

FUN For matrix arguments  X , the  functions  SIN,  COS,  ATAN,
    SQRT,  LOG,  EXP and X**p are computed using eigenvalues  D
    and eigenvectors  V .  If  <V,D> =  EIG(X)   then   f(X)  =
    V*f(D)/V  .   This method may give inaccurate results if  V
    is badly conditioned.  Some idea of  the  accuracy  can  be
    obtained by comparing  X**1  with  X .
    For vector arguments,  the  function  is  applied  to  each
    component.
```

Since then, and especially in the last five years or so, the quantity of software for matrix functions has grown tremendously—to such an extent that it is hard to keep track of what is available. This document is an attempt to produce a catalogue of software for matrix functions available in different languages and packages.

The document lists what is available with a brief description of and reference to the algorithms that are used (where known). We make no attempt to judge the quality of the software. We also do not document version numbers; for software still under development we are referring to the version current at the time of writing. This document is not intended to be exhaustive. For example, if a code or package has been superseded or is a translation of an existing code to another language we will usually omit it.

We intend to update the catalogue from time to time and welcome notification of errors and omissions.

For background on functions of matrices see [37], [39], or [44].

2 Applications of Matrix Functions

Matrix functions have applications in a diverse and growing range of areas of science, engineering, and the social sciences. We list a selection of areas in which we are aware of the use of matrix function software.

- Multizone models of pollutant transport in buildings take the form of linear systems of ordinary differential equations, which can be effectively solved using the matrix exponential [60].
- In Markov models in finance, statistics and social science [37, Sec. 2.3] transition probability matrices are related to the transition intensity matrix via the matrix exponential. Transition matrices for shorter time scales can be generated by taking matrix roots, but there are open questions about the existence and uniqueness of stochastic roots [41], [48].

- NMR spectroscopy involves evaluating the exponential of a symmetric diagonally dominant relaxation matrix [33], [56]. The package SIMPSON (`http://nmr.au.dk/software/simpson`) for numerical simulations of NMR experiments includes several methods for evaluating the matrix exponential.

- In control theory, linear dynamical systems can be expressed as continuous-time systems or as discrete-time state-space systems. The matrix exponential and logarithm can be used to convert between the two forms [37, Sec. 2.4]. In the Control System Toolbox for MATLAB, functions `c2d` and `d2c` carry out these conversions.

- In nuclear engineering the burnup equations are a first-order system of linear ordinary differential equations that are usually solved by time-stepping with the matrix exponential [62]. The Python Nuclear Engineering Toolkit (`http://pynesim.org`) uses the SciPy function `linalg.expm` (see Section 17).

- In social and information networks the elements of either the exponential or the resolvent of the adjacency matrix of the network can be used to quantify the importance of nodes within the network [22]. Recent research and software development has focused on computing these elements, including in cases with special structure; see [11] and the references therein. In time-varying networks the matrix logarithm is required [29].

- A number of problems in imaging make use of the matrix logarithm, including image registration [9], patch modeling-based skin detection [46], and in-betweening in computer animations [63].

- In optics, the Mueller matrix M is a real 4×4 matrix associated with an element that alters the polarization of light. One method for determining the diattenutation, retardance, and depolarization properties of M involves computing a pth root with $p \approx 10^5$ [16], [58]. The logarithm of M also provides understanding of the underlying medium that M describes [59]. A related Jones matrix can be represented in terms of the matrix exponential [10].

3 Matrix Function Algorithms

There is now a large literature on matrix function algorithms, of which a survey as of 2010 is given in [40]. It may not be clear to users from different fields which algorithms represent the current state-of-the-art. We list the algorithms that we consider to be preferred for a few common matrix functions, for the case where a factorization of A can be explicitly computed and full precision is required.

- Exponential: scaling and squaring algorithm (Al-Mohy and Higham, 2009) [3].

- Logarithm: inverse scaling and squaring algorithm (Al-Mohy, Higham, and Relton, 2012, 2013) [6], [7].

- Square root: Schur algorithm (Björck and Hammarling, 1983) [14], or real version for real matrices (Higham, 1987) [35]. Algorithm with blocking provides performance improvements (Deadman, Higham, and Ralha, 2013) [18].

- General matrix function with derivatives of the underlying scalar function available: Schur–Parlett algorithm (Davies and Higham, 2003) [17]. This uses the recurrence of Parlett (1976) [61].

- Real matrix power A^t with $t \in \mathbb{R}$: Schur–Padé algorithm (Higham and Lin, 2013) [43].

Table 1: Availability of recommended algorithms.

	MATLAB built-in Sec. 4	MATLAB Third party Secs 6 and 8	NAG Library Sec. 16	SciPy Sec. 17
e^A [3]	×	√	√	√
$\log A$ [6], [7]	×	√	√	√
$A^{1/2}$ [14], [18], [35]	√	√	√	√
$f(A)$ [17]	√	–	√	×
A^t [43]	×	√	√	√
Estimation of $\mathrm{cond}(f, A)$	×	√	√	×
$e^A b$ [5][a]	×	√	√	√
$L_{\exp}$ [2]	×	√	√	√
$L_{\log}$ [7]	×	√	√	×
L_{x^t} [43]	×	√	√	×

[a] Krylov methods are also available; see the following sections.

- Function of a symmetric or Hermitian matrix: diagonalization.

In many applications of matrix functions the matrix is not known exactly, due to data errors or errors in previous computations. Even with exact data the computation of a matrix function is subject to rounding errors. It is therefore important to understand the sensitivity of the matrix function to perturbations in the data, which is determined by the Fréchet derivative, denoted L_f. The recommended algorithms for computing the Fréchet derivative are as follows.

- Exponential: scaling and squaring algorithm (Al-Mohy and Higham, 2009) [2].
- Logarithm: inverse scaling and squaring algorithm (Al-Mohy, Higham, and Relton, 2013) [7].
- Real matrix power A^t with $t \in \mathbb{R}$: Schur–Padé algorithm (Higham and Lin, 2013) [43].
- General matrix function: complex step algorithm (Al-Mohy and Higham, 2010) [4] or use of a block 2×2 matrix formula [40, Sec. 7.3].

Table 1 summarizes the availability of the above algorithms in four key sources of software. Details are provided in the following sections.

The worst-case sensitivity of a matrix function over all perturbations is measured by the condition number, $\mathrm{cond}(f, A)$ [37, Chap. 3]. The recommended way to estimate the condition number is by using one of the above algorithms for the Fréchet derivative in conjunction with [37, Alg. 3.22] and the block matrix 1-norm estimator of [45]. We encourage users to compute a condition number estimate whenever possible.

A rather different problem is to compute $f(A)b$, where b is a vector—the action of $f(A)$ on a vector—without explicitly forming $f(A)$. Such problems can involve very large, sparse matrices, in which case matrix factorization may not be possible and methods that require only matrix–vector products with A are needed. Codes for the $f(A)b$ problem are described in some of the following sections.

4 MATLAB Built-in Functions

MATLAB has a number of built-in commands for evaluating functions of matrices.

- `funm`: Schur–Parlett algorithm for general functions (Davies and Higham, 2003) [17].
- `expm`: matrix exponential by scaling and squaring algorithm (Higham, 2005, 2009) [36], [38]. *Note*: `expm` does not use the latest algorithm from [3], which avoids overscaling; see [52].
- `expmdemo1`: matrix exponential by an older scaling and squaring algorithm [26, Alg. 9.3.1]. This is an M-file implementation of the algorithm that was used by `expm` in MATLAB 7 (R14SP3) and earlier versions.
- `mpower`, `^`: arbitrary matrix power via eigendecomposition.
- `expmdemo2`: matrix exponential by Taylor series.
- `expmdemo3`: matrix exponential by eigenvalue decomposition.
- `logm`: matrix logarithm by Schur–Parlett algorithm with inverse scaling and squaring algorithm (Higham, 2008) [37, Alg. 11.11]. *Note*: `logm` does not use the latest algorithm from [6], [7].
- `sqrtm`: matrix square root by Schur method (Björck and Hammarling, 1983) [14].
- `polyvalm`: evaluate polynomial with matrix argument.

5 Symbolic Math Toolbox for MATLAB

The Symbolic Math Toolbox for MATLAB [68] carries out computations with symbolic variables and also provides variable precision arithmetic. The toolbox overloads the following functions for both symbolic and variable precision matrix arguments. For variable precision arguments the function `digits` can be used to specify the number of digits of precision required.

- `expm`: matrix exponential.
- `mpower`, `^`: arbitrary matrix power via eigendecomposition.

The Symbolic Math Toolbox also contains the MuPAD computer algebra system, which provides some additional matrix function capabilities for matrices with numeric (not symbolic) entries.

- `numeric::expMatrix`: computes the matrix exponential or the action of the matrix exponential on another matrix or vector. The numerical precision used can be specified by the environment variable `DIGITS`. The exponential is evaluated using a choice of diagonalization, interpolation, a Taylor series (apparently without scaling and squaring), or (for $e^A b$ only) a Krylov subspace method.
- `numeric::fMatrix`: for a diagonalizable matrix, computes an arbitrary function of the matrix via a diagonalization.

6 The Matrix Function Toolbox

The Matrix Function Toolbox (Higham, 2008) [34] contains MATLAB implementations of many of the algorithms described in the book *Functions of Matrices: Theory and Computation* [37], including:

- trigonometric matrix functions,
- condition number evaluation and estimation,
- Fréchet derivative evaluation,
- polar decomposition,
- iterative methods for computing matrix roots,
- $f(A)b$ via Arnoldi method.

The toolbox is documented in [37, App. D] and its contents are summarized in Table 2.

Table 2: Contents of Matrix Function Toolbox.

`arnoldi`	Arnoldi iteration
`ascent_seq`	Ascent sequence for square (singular) matrix.
`cosm`	Matrix cosine by double angle algorithm.
`cosm_pade`	Evaluate Padé approximation to the matrix cosine.
`cosmsinm`	Matrix cosine and sine by double angle algorithm.
`cosmsinm_pade`	Evaluate Padé approximations to matrix cosine and sine.
`expm_cond`	Relative condition number of matrix exponential.
`expm_frechet_pade`	Fréchet derivative of matrix exponential via Padé approximation.
`expm_frechet_quad`	Fréchet derivative of matrix exponential via quadrature.
`fab_arnoldi`	$f(A)b$ approximated by Arnoldi method.
`funm_condest1`	Estimate of 1-norm condition number of matrix function.
`funm_condest_fro`	Estimate of Frobenius norm condition number of matrix function.
`funm_ev`	Evaluate general matrix function via eigensystem.
`funm_simple`	Simplified Schur–Parlett method for function of a matrix.
`logm_cond`	Relative condition number of matrix logarithm.
`logm_frechet_pade`	Fréchet derivative of matrix logarithm via Padé approximation.
`logm_iss`	Matrix logarithm by inverse scaling and squaring method.
`logm_pade_pf`	Evaluate Padé approximant to matrix logarithm by partial fraction form.
`mft_test`	Test the Matrix Function Toolbox.
`mft_tolerance`	Convergence tolerance for matrix iterations.
`polar_newton`	Polar decomposition by scaled Newton iteration.
`polar_svd`	Canonical polar decomposition via singular value decomposition.
`polyvalm_ps`	Evaluate polynomial at matrix argument by Paterson–Stockmeyer algorithm.
`power_binary`	Power of matrix by binary powering (repeated squaring).
`quasitriang_struct`	Block structure of upper quasitriangular matrix.
`riccati_xaxb`	Solve Riccati equation $XAX = B$ in positive definite matrices.
`rootpm_newton`	Coupled Newton iteration for matrix pth root.
`rootpm_real`	pth root of real matrix via real Schur form.
`rootpm_schur_newton`	Matrix pth root by Schur–Newton method.
`rootpm_sign`	Matrix pth root via matrix sign function.
`signm`	Matrix sign decomposition.
`signm_newton`	Matrix sign function by Newton iteration.
`sqrtm_db`	Matrix square root by Denman–Beavers iteration.
`sqrtm_dbp`	Matrix square root by product form of Denman–Beavers iteration.

Table 2: (continued)

sqrtm_newton	Matrix square root by Newton iteration (unstable).
sqrtm_newton_full	Matrix square root by full Newton method.
sqrtm_pd	Square root of positive definite matrix via polar decomposition.
sqrtm_pulay	Matrix square root by Pulay iteration.
sqrtm_real	Square root of real matrix by real Schur method.
sqrtm_triang_min_norm	Estimated minimum norm square root of triangular matrix.
sylvsol	Solve Sylvester equation.

7 The Advanpix Multiprecision Computing Toolbox

The Advanpix Multiprecision Toolbox [54] is an extension to MATLAB for computing with arbitrary precision. The toolbox provides arbitrary precision analogues to the built-in MATLAB matrix functions as well as some trigonometric matrix functions. It is specifically optimized for quadruple precision.

The following matrix function routines are available in the toolbox: `funm`, `expm`, `sqrtm`, `logm`, `sinm`, `cosm`, `sinhm`, and `coshm`. The first four use the same algorithms as their MATLAB counterparts, with some adaptations to arbitrary precision.

8 Other MATLAB Functions

MATLAB functions implementing algorithms developed in several research papers are available online.

- Al-Mohy and Higham (2009) [3]: a scaling and squaring algorithm for the matrix exponential. Available from `http://eprints.ma.man.ac.uk/1442/`
- Al-Mohy and Higham (2011) [5]: a scaled Taylor series algorithm for the action of the matrix exponential on a vector. Available from `http://www.mathworks.com/matlabcentral/fileexchange/29576-matrix-exponential-times-a-vector`
- Al-Mohy and Higham (2011) [6]: an inverse scaling and squaring algorithm for the matrix logarithm. Available from `http://www.mathworks.com/matlabcentral/fileexchange/33393-matrix-logarithm`.
- Al-Mohy, Higham, and Relton (2013) [7]: an algorithm for the matrix logarithm (a real version of the algorithm in [6]) together with Fréchet derivatives and condition number estimates. Available from `http://www.mathworks.com/matlabcentral/fileexchange/38894-matrix-logarithm-with-frechet-derivatives-and-condition-number`.
- Aprahamian and Higham (2014) [8]: an algorithm for computing the matrix unwinding function. Available at `http://eprints.ma.man.ac.uk/2094`.
- Caliari et al. (2013) [15]: a method for computing the action of the matrix exponential (for a matrix with spectrum in the left half of the complex plane) based on interpolation at Leja points. Available from `http://www.mathworks.com/matlabcentral/fileexchange/44039-matrix-exponential-times-a-vector`

- Eiermann and Güttel (2008) [1], [20]: a restarted Krylov algorithm for computing $f(A)b$; it also implements deflated restarting [21]. Available from `http://www.guettel.com/funm_kryl`.
- Frommer, Güttel and Schweitzer (2013) [23]: a quadrature-based restarted Krylov method for $f(A)b$. Available from `http://www.guettel.com/funm_quad`.
- Greco and Iannazzo (2010) [28]: a binary powering Schur algorithm for matrix roots. Available from `http://poisson.phc.unipi.it/~maxreen/bruno/codes/rootpm_real_2.m`.
- Güttel (2010): a rational Chebyshev series method for computing $e^A b$, where A is symmetric and has no positive eigenvalues. Available from `http://www.mathworks.com/matlabcentral/fileexchange/28199-matrix-exponential`.
- Güttel and Knizhnerman (2011) [30]: a black-box rational Arnoldi method for computing $f(A)b$, where f is a Markov matrix function. Available from `http://guettel.com/markovfunmv`. See also [31].
- Hale, Higham and Trefethen (2008) [32]: algorithms for evaluating $f(A)$ and $f(A)b$ by contour integration. MATLAB code is embedded in the paper.
- Higham and Lin (2013) [43]: a Schur–Padé algorithm for fractional matrix powers together with Fréchet derivatives and condition estimates. Available from `http://www.mathworks.com/matlabcentral/fileexchange/41621-fractional-matrix-powers-with-frechet-derivatives-and-condition-number-estimate`
- Iannazzo and Manasse (2012) [47]: a Schur logarithmic algorithm for fractional powers of matrices. Available from `http://poisson.phc.unipi.it/~maxreen/bruno/codes/pthrootlog.m`.
- Kloster and Gleich [50]: an algorithm for computing a column of the exponential of a stochastic matrix. Code is available from `https://www.cs.purdue.edu/homes/dgleich/codes/nexpokit`.

9 Expokit

Expokit (Sidje, 1998) [66], [67] is a package of Fortran and MATLAB codes to compute e^A (using scaling and squaring) and $e^A b$ (using Krylov subspace methods). An R interface to Expokit is available at `http://cran.r-project.org/web/packages/expoRkit`.

10 EXPINT

EXPINT (Berland, Skaflestad and Wright, 2007) [12], [13] is a MATLAB package providing exponential integrators for ordinary differential equations. A large range of Runge–Kutta, multistep and general linear integrators is available. The functions $\varphi_k(z) = \sum_{j=0}^{\infty} z^j/(j+k)!$ underlying the methods are evaluated at matrix arguments using Padé approximants with a scaling and squaring scheme.

11 GNU Octave

GNU Octave [24] is an open source problem-solving environment (PSE)[1] with a high-level programming language similar to (and mostly compatible with) MATLAB. It contains several matrix function routines.

- `expm`: matrix exponential by Ward's version of the scaling and squaring algorithm (1977) [70].
- `logm`: matrix logarithm by an inverse scaling and squaring algorithm (Higham, 2008) [37].
- `sqrtm`: matrix square root by the Schur method (Björck and Hammarling, 1983) [14].

An extra linear algebra package is available for Octave `http://octave.sourceforge.net/linear-algebra/`. This contains some additional matrix function routines.

- `thfm`: trigonometric and hyperbolic functions and their inverses. It implements textbook definitions, in terms of `expm`, `logm`, and `sqrtm`.
- `funm`: general matrix function via diagonalization.

12 Scilab

Scilab [64] is another open source PSE. Scilab syntax is similar to that of MATLAB and a code translator is available to convert code from MATLAB to Scilab. Scilab contains several matrix function routines.

- `expm`: matrix exponential using block diagonalization with a Padé approximant applied to each block.
- `logm`: matrix logarithm via diagonalization.
- `sqrtm`: matrix square root via diagonalization.
- `power`: matrix power using diagonalization for non-integer powers.

13 φ Functions in Fortran 95

Koikari (2009) [51] has written Fortran 95 software for computing the functions $\varphi_\ell(z) = \sum_{k=0}^{\infty} z^k/(k+\ell)!$ by scaling and squaring and by a block Schur–Parlett algorithm. The code is available as a supplement to the paper on the ACM website.

14 Maple

Maple contains some matrix function routines in its `LinearAlgebra` package. The matrix functions are computed symbolically using polynomial interpolation at the matrix eigenvalues.

- `MatrixExponential`: exponential of a matrix.
- `MatrixPower`: general (non-integer) power of a matrix.
- `MatrixFunction`: general function of a matrix. The function is supplied in the form of an analytic expression by the user.

[1] A PSE provides a programming language, an interactive command window with the display of graphics, and the ability to export graphics and more generally publish documents to HTML, PDF, TEX, and so on.

15 Mathematica

Mathematica evaluates the functions listed below via a Jordan decomposition if the matrix is provided in symbolic form. If the matrix is in floating point format the indicated algorithms are used.

- `MatrixFunction`: the Schur–Parlett algorithm [17] is used to evaluate a general matrix function (derivatives are computed symbolically).
- `MatrixExp`: the matrix exponential is computed by scaling and squaring [36], [38]. This function can also compute the action of the matrix exponential on a vector, using Krylov methods.
- `MatrixLog`: the matrix logarithm is evaluated via a Schur decomposition. The action of the matrix logarithm on a vector can also be computed.

16 NAG Library

The NAG Library [55] has a large set of matrix function routines in its Chapter F01, covering computation of matrix functions and their Fréchet derivatives and estimation of the condition numbers of matrix functions.

- NAG Fortran Library Mark 23 and NAG Toolbox for MATLAB Mark 23 (released 2011):
  - Matrix exponential using scaling and squaring algorithm (Higham, 2005) [36], [38].
  - Function of real symmetric or Hermitian matrix via eigendecomposition.
- NAG C Library Mark 23, released 2012, also contains:
  - Schur–Parlett algorithm for general functions and for cos, sin, cosh, sinh, exp (Davies and Higham, 2003) [17].
  - Matrix logarithm by Schur–Parlett algorithm with inverse scaling and squaring algorithm (Higham, 2008) [37].
- NAG Fortran Library Mark 24 and the NAG Toolbox for MATLAB Mark 24 (released 2013) also contain:
  - Action of the matrix exponential by scaled Taylor series algorithm (Al-Mohy and Higham, 2011) [5].
  - Condition number estimation in the 1-norm for general matrix functions and for cos, sin, cosh, sinh, exp.
- Coming in NAG C Library Mark 24 (2014), NAG Fortran Library Mark 25 (2015), and NAG Toolbox for MATLAB Mark 25 (2015):
  - Improved scaling and squaring algorithms for matrix exponential and logarithm (Al-Mohy and Higham, 2009, 2012) [3], [6].
  - Matrix square root using Schur method with blocking (including real arithmetic algorithm of Higham [35]) [14], [18], [35].
  - Matrix power $A^p, p \in \mathbb{R}$, via Schur–Padé algorithm (Higham and Lin, 2011, 2013) [42], [43].

– Latest Fréchet derivative and condition number algorithms for the matrix exponential, logarithm, and real powers [2], [7], [43].

Documentation can be found at: `http://www.nag.co.uk/support_documentation.asp`. A complete list of all of the NAG matrix function routines, together with their Mark of introduction and the algorithms used, is given in Table 3.

17 Python: SciPy

SciPy [65] is a Python package for scientific computing. It has a number of matrix function codes, some of which are new to version 0.13.0, released in October 2013:

- `linalg.expm3`, `linalg.expm2`, `linalg.expm`: matrix exponential using Taylor series, eigenvalue decomposition, and scaling and squaring (Higham, 2005) [36], respectively.
- `sparse.linalg.expm`: matrix exponential using the more recent algorithm of Al-Mohy and Higham (2009) [3].
- `linalg.logm`: matrix logarithm via inverse scaling and squaring algorithm (Al-Mohy and Higham, 2012) [6].
- `linalg.sinm`, `linalg.cosm`, `linalg.tanm`, `linalg.sinhm`, `linalg.coshm`, `linalg.tanhm`: implemented in terms of `linalg.expm`.
- `linalg.funm`: unblocked Schur–Parlett algorithm [26, Alg. 9.1.1], [37, Alg. 4.1.3].
- `linalg.fractional_matrix_power`: arbitrary real power of matrix by Schur–Padé algorithm (Higham and Lin, 2011, 2013) [42], [43].
- `linalg.signm`: matrix sign function via Newton iteration [37, Sec. 5.3].
- `linalg.expm_frechet`: Fréchet derivative of matrix exponential by scaling and squaring algorithm (Al-Mohy and Higham, 2009) [2].
- `linalg.sqrtm`: matrix square root by blocked version of Schur method of Björck and Hammarling (1983) [14], [18].
- `linalg.expm_multiply`: action of matrix exponential on a vector or matrix via scaled Taylor series algorithm (Al-Mohy and Higham, 2011) [5].
- `linalg.polar`: polar decomposition via the SVD [37, Chap. 8].

18 Python: SymPy

SymPy [69] is a Python library for symbolic mathematics. It contains some numerical matrix function capabilities in its `mpmath` module and variable precision arithmetic is supported. The precision is set using either `mp.prec` (to set the binary precision, measured in bits) or `mp.dps` (to set the decimal precision).

- `mpmath.expm`: matrix exponential by scaling and squaring with Taylor series or Padé approximant.
- `mpmath.sinm`, `mpmath.cosm`: matrix sine and cosine implemented via the matrix exponential.

Table 3: Matrix Function Routines in the NAG Library.

Short Name	Long Name	Purpose	Arithmetic	Algorithms Used	Marks of Introduction
F01EC	nag_real_gen_matrix_exp	Exponential	Real	Scaling & squaring [3]	FL22 & CL9 [1]
F01ED	nag_real_symm_matrix_exp	Exponential, symmetric matrix	Real	Diagonalization	FL23 & CL9

- `mpmath.sqrtm`: matrix square root evaluated using the Denman–Beavers (1976) iteration [19].
- `mpmath.logm`: matrix logarithm evaluated via inverse scaling and squaring and a Taylor series.
- `mpmath.powm`: A^p for $p \in \mathbb{C}$ implemented as $e^{p \log A}$.

Note that both SymPy and SciPy are available in Sage (`http://www.sagemath.org`), an open source Python-based mathematical software package.

19 Julia

Julia [49] is an open-source, high-level, dynamic programming language designed specifically for high-performance numerical and scientific computing. Its extensive mathematical function library is largely written in Julia itself, but also includes calls to other libraries such as LAPACK and OpenBLAS. Two matrix function routines are available in the Julia Standard Library:

- `sqrtm`: matrix square root using Schur method of Björck and Hammarling (1983) [14].
- `expm`: matrix exponential using the scaling and squaring algorithm of Higham (2005) [36], [38].

20 R: Expm

Goulet, Dutang, Maechler, Firth, Shapira, and Stadelmann have written the R package expm [27]. It contains codes not only for the matrix exponential but also for the logarithm and square root.

- `expm`: the default is `expm.Higham08`, which uses the algorithm of (Higham, 2005) [36], [38]. Also available are options for using an eigendecomposition and other Padé and Taylor-based methods.
- `expAtv` uses a Krylov method of Sidje (1998) [67] to compute the action of the matrix exponential on a vector.
- `expmCond`: computes or approximates the 1-norm or Frobenius norm condition number of the matrix exponential using the algorithm of Al-Mohy and Higham (2009) [2] or methods from [37, Sec. 3.4].
- `expmFrechet`: Fréchet derivative of matrix exponential (Al-Mohy and Higham, 2009) [2].
- `logm`: matrix logarithm by inverse scaling and squaring (Higham, 2008) [37, Alg. 11.9].
- `sqrtm`: matrix square root by the Schur method (Björck and Hammarling, 1983) [14].
- `matpow`: positive integer powers via binary powering.

21 C++: Eigen

Niesen has written a matrix functions module for the Eigen C++ template library for linear algebra [57].

- `MatrixBase::exp()`: matrix exponential by scaling and squaring algorithm (Higham, 2005) [36], [38].
- `MatrixBase::sin()`, `MatrixBase::sinh()`, `MatrixBase::cos()`, `MatrixBase::cosh()` and `MatrixBase::matrixFunction()` are all based on the Schur–Parlett algorithm (Davies and Higham, 2003) [17].
- `MatrixBase::log()`: matrix logarithm by the Schur–Parlett algorithm with inverse scaling and squaring [37, Alg. 11.11].
- `MatrixBase::pow()`: real matrix powers A^t ($t \in \mathbb{R}$) using the Schur–Padé algorithm (Higham and Lin, 2011) [42].
- `MatrixBase::sqrt()`: matrix square root by Schur method (Björck and Hammarling, 1983) [14] and the real Schur method (Higham, 1987) [35].

22 The GNU Scientific Library

The GNU Scientific Library (GSL) is an open-source numerical library written in C (although wrappers exists for many other programming languages) [25]. GSL includes an undocumented function `gsl_linalg_exponential_ss` to compute the matrix exponential. This routine uses scaling and squaring and a truncated Taylor series. The scaling and truncation parameters are chosen as in Moler and Van Loan (2003) [53, Method 3].
